

~~Abbildung 1: Sägezahnspannung an RL-Schaltung~~

$$\text{MASCHENGLEICHUNG: } L(s) = L_L(s) + L_R(s) = I(s) \cdot R + s \cdot L \cdot I(s) - L \cdot z_0$$

$$\Leftrightarrow I(s) = \frac{L(s) + L \cdot i_0}{R + sL} \quad (1)$$

$$F_{\text{FCR}} \quad 0 \leq t \leq T \quad : \quad L(t) = \frac{\bar{L}}{T} \cdot t \quad \text{---} \quad L(s) = \frac{\bar{L}}{T} \cdot \frac{1}{s^2}$$

$$\text{EINSETZEN in (1) : } I(s) = \frac{L(s) + L \cdot i_0}{R + sL} = \frac{L}{T} \cdot \frac{1}{s^2(R+SL)} + \frac{L \cdot i_0}{R+SL}$$

→ UNIFORM  
FOR ALL S : )

$$I(s) = \frac{\dot{L}}{TR} \cdot \frac{1}{s^2 \left( 1 + \frac{sL}{R} \right)} + \frac{L \cdot i_0}{R \left( 1 + \frac{sL}{R} \right)}$$

$\tau := \frac{L}{R}$

$$i(t) = \frac{\frac{L}{T \cdot R}}{t - \frac{L}{R} + \frac{L}{R} e^{-\frac{t \cdot R}{L}}} S(t) + \left[ \underbrace{c_0 \cdot \exp\left(\frac{-t \cdot R}{L}\right)}_{=0} \right] S(t)$$

für  $t \in [0, T]$

$$\text{Für } t \in [T, 2T] \text{ gilt } i_0 = i(T) = \frac{\frac{L}{T \cdot R}}{T - \frac{L}{R} + \frac{L}{R}} e^{-\frac{T \cdot R}{L}}$$

Und somit:

$$i(t) = \frac{\frac{L}{T \cdot R}}{(t-T)} - \frac{L}{R} + \frac{L}{R} e^{-\frac{(t-T) \cdot R}{L}} \exp(-\frac{(t-T) \cdot R}{L}) + \underbrace{\left[ \frac{\frac{L}{T \cdot R}}{T - \frac{L}{R} + \frac{L}{R}} e^{-\frac{T \cdot R}{L}} \right]}_{= i(T)} \exp(-\frac{(t-T) \cdot R}{L}) \exp(-\frac{(t-T) \cdot R}{L})$$

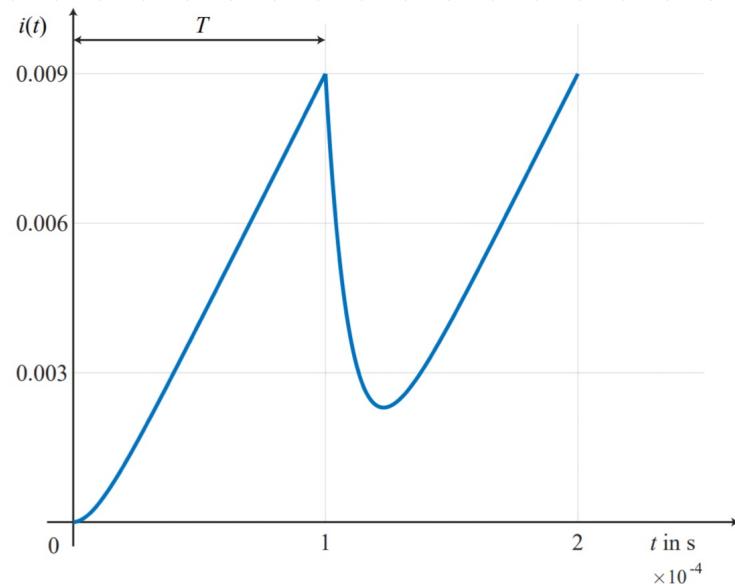

Abbildung 2: Strom  $i(t)$
